A large globe on a stand is positioned in the foreground on the right side of the image. The globe is dark and has a grid of latitude and longitude lines. The background is a vast, flat desert landscape under a bright, low sun, creating a hazy, golden atmosphere. In the distance, two small figures are walking, and a bicycle is visible. The overall scene is serene and evocative.

AJ 5.9

Magic Lantern for 5D_{mk2} @ 2.0.9

www.olivejuice.co.uk

Magic Lantern - 5D Mark 2

Magic Lantern is software written by enthusiasts to extend Canon camera's functionality!

How?

- ❖ **ML** It is packaged up as a 'Firmware Update'
- ❖ Then uploaded into RAM from the CompactFlash card

Magic Lantern was originally developed by Trammell Hudson for the 5D2 to overcome some of the shortcomings of its software.

This version of Magic Lantern was **developed by** Antony Newman (**AJ**)

How do I get Magic Lantern working?

[1] Get the latest version ZIP of the AJ version of Magic Lantern from the 'Wiki'
❖ <http://magiclantern.wikia.com/wiki/>

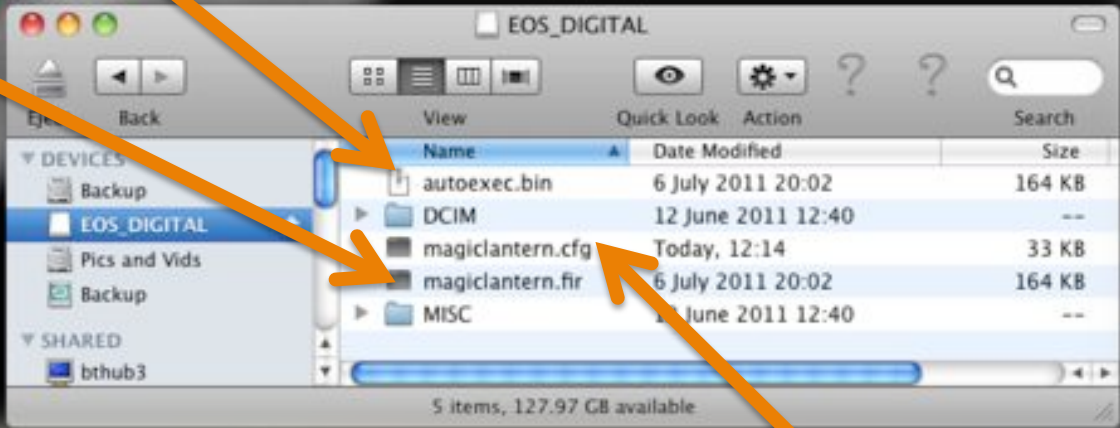

Supported cameras

5D Mark II  Edit

- AJ builds of Magic Lantern for 5D Mark II firmware 2.0.9 (AJ 5.9)

[2] Copy **magiclantern.fir** and **autoexec.bin** onto your Canon formatted Compact Flash.

[3] Switch on your Camera in the 'M'annual mode.

[4] Use Canon menu to upload firmware into RAM.
Note: Remove battery to 100% delete ML from RAM!

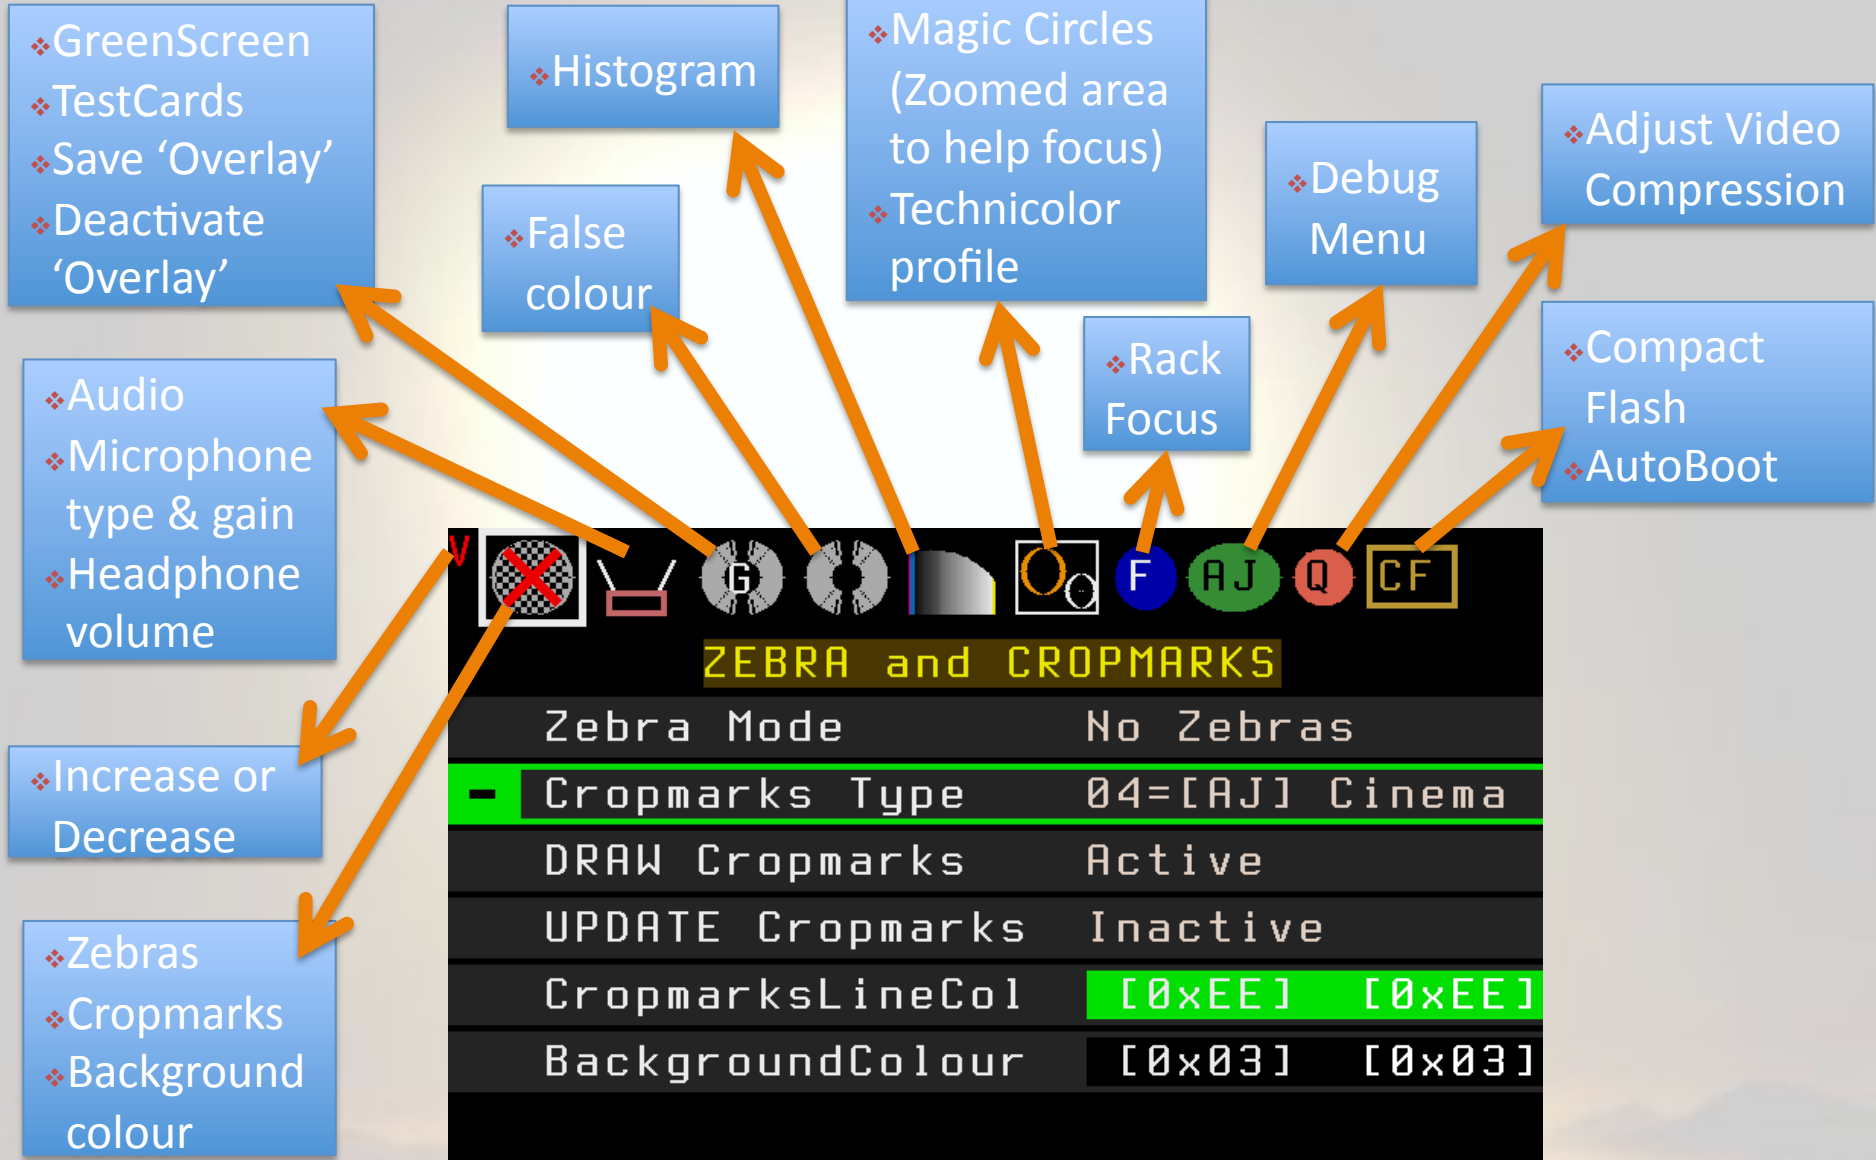

The **magiclantern.cfg** file is created when you save the current configuration.

[5] 'Magic Lantern 5.x' appears.
'LiveView' activates -> That's it!

- ❖ Live View 
- ❖ Canon Menu 
- ❖ AJ Menu 

AJ Menu

```

ZEBRA and CROPMARKS
Zebra Mode          No Zebras
- Cropmarks Type    04=[AJ] Cinema
DRAW Cropmarks      Active
UPDATE Cropmarks    Inactive
CropmarksLineCol    [0xEE] [0xEE]
BackgroundColour    [0x03] [0x03]

X[000-720] Y[070-370] Safe=off <[AJ] Cinema Wide 2.35>
    
```

Zebras and Cropmarks

Zebras : What are they? (Ans) Feedback on the Screen Overlay

❖ Any **Brightness** detail > **Maximum**, is recorded at = max level,
And you **lose all** detail (and **can never recover it!**).
Red 'Checker-board' is used to indicate 'Over-exposure'

❖ Any **Brightness** detail < **Minimum** is **lost**.
Blue 'Check-board' is used to indicate 'Under-exposure'

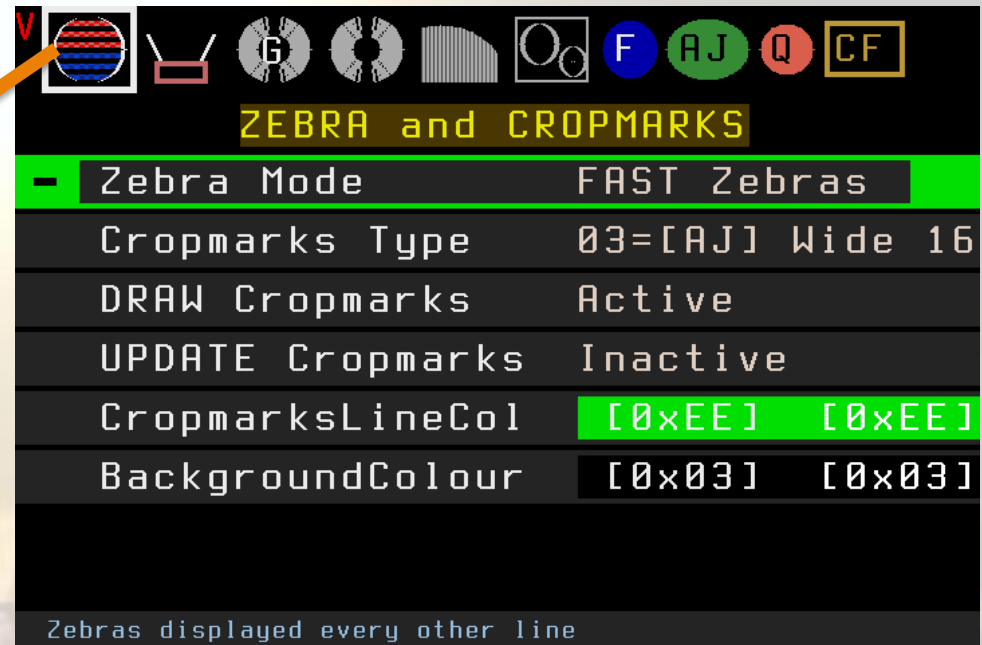

Zebras can be:

- ❖ OFF - Do Nothing
- ❖ Fast - Only display hatching on every other line
- ❖ Slow - Use a solid Fill

Note 1: Use 'Fast' Zebras as:

- ❖ 'Slow' takes more CPU power.
- ❖ 'Slow' will hide Cropmarks!

Note 2: 'False Colours' (later menu)
are a more advanced way of
checking exposure

Zebras and Cropmarks

FYI: This is the 'Slow' Zebra icon (Every line is hatched in the Overlay)

CROPMARKS : What are they?
 (Ans) Framing information displayed over the picture (an 'Overlay').

- ❖ It is NOT recorded with Movie.
- ❖ Appears as an onscreen rectangle
- ❖ Optional 'Safe' lines

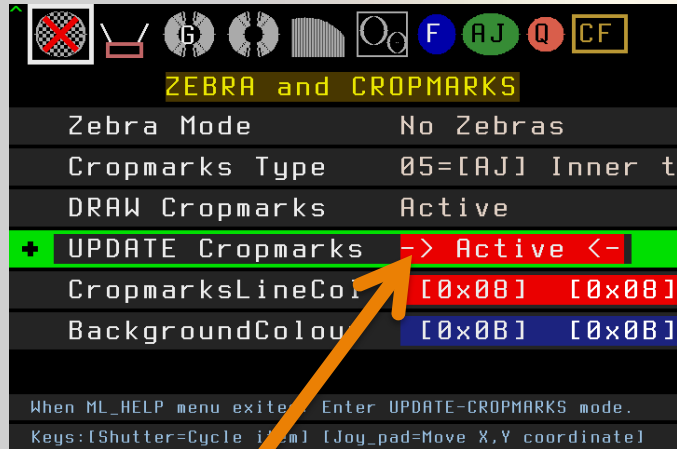

- ❖ A full list can be 'cycled' through from the AJ Menu.
- ❖ This list is also at the bottom of the ML Config file.

```

focus.rack-speed = 4
#==Cropmark_Name===== s Saf vXv ^X^ vYv ^Y^
!Full Screen          0 000 000 720 000 425
![CB] Wide 16 : 9     0 000 005 710 040 400
![CB] Cinema Wide 2.35 0 000 005 710 070 370
![AJ] Wide 16 : 9     0 000 000 720 040 400
![AJ] Cinema Wide 2.35 0 000 000 720 070 370
![AJ] Inner test1     1 100 100 620 040 400
    
```

Zebras and Cropmarks

UPDATE Cropmarks = **Active**

X=0, Y=0

Exit Menu -> Update mode

X=720, Y=0

INT 23.00
INT 17.50 14.0 1250 37 cm 098

X=0, Y=425

X=720, Y=425

Cropmark Update Mode

❖ Exit ML_Menu -> Now it update mode

❖ <SHUTTER> cycles between:

TOP_LEFT of cropmark

BOTTOM_RIGHT of cropmark

OPTIONAL_SAFE_LINE of cropmark

❖ Details of Cropmark item are displayed in real time. Eg TopLeft [X=022, Y=190]

Keys:

+) <SHUTTER>: Cycle item

+) <Joy Pad>: Change X,Y of Item

To exit this mode

-> select Menu

-> 'UPDATE Cropmarks' -> Inactive.

AUDIO

- ❖ The 5D2 has a small **INT**ernal microphone ('fun' quality)
- ❖ For high-fidelity sound → use an **external microphone**.
For the minimum signal hiss (ie best Signal to Noise), it's low level signal should be amplified before connecting to the 5D2.

AUDIO			
L&R Analog Gain	10 dB		00
L Digital Gain	6 dB		01
R Digital Gain	12 dB		02
Microphone Input	A>L=INT R=INT		03
Headphone Volume	6		04
Audio o2gain	-0 dB		05
Audio Loopback	Active		06

TOT_(L or R)_GAIN = ANALOG_GAIN + DIGIT_GAIN (def=0)

Set using Loudest signal:

- ① Set External Amp gain (eg 20 dB)
<it's Amp is better than the 5D2>
- ② Set 5D2 Analogue gain next
<Make sure signal does not clip!>
- ③ Finally set the 5D2 Digital gain
<Doesn't add any recorded quality>
<Useful for Headphone monitoring>

Q = Video Compression

+	Off/ CBR/ VBR	OFF
	CBR	100 %
	VBR (Q-scale)	- 8 [Default]
	_RECORDING	No
	_CF_FREE_SPACE	128.63 GB
	_Rec_Bitrate	no info

Override Data rate used to store movies.
ConstantBitRate (uses '%') / VariableBitRate (Qscale)

- ❖ This is Informational!
- ❖ You are not allowed to change settings when Recording.

- ❖ When recording is started, this field is cleared.
- ❖ After the CF reports its size has reduced (which may take some time), the approximate bit rate is updated into this field.

CBR (Constant Bit Rate) = DryOs limits the data rate when writing movies to CF to this value.

Canon's default is to use a CBR of around 48Mb/sec to ensure that most CFs can keep up.

VBR (Variable Bit Rate) = DryOs attempts to maintain a certain 'Quality' of image.
WARNING: Actual data rate fluctuate and may stop recording if the write buffer runs out!

Q = Video Compression

❖ Constant Bit Rate active.

❖ New CBR ceiling is 140% DryOs maximum.
❖ Current Quality=-10 (only shows when recording)

DryOs 'Write Buffer' is running out! (Doesn't help if you are Recording and doing a screen dump at the same time :).

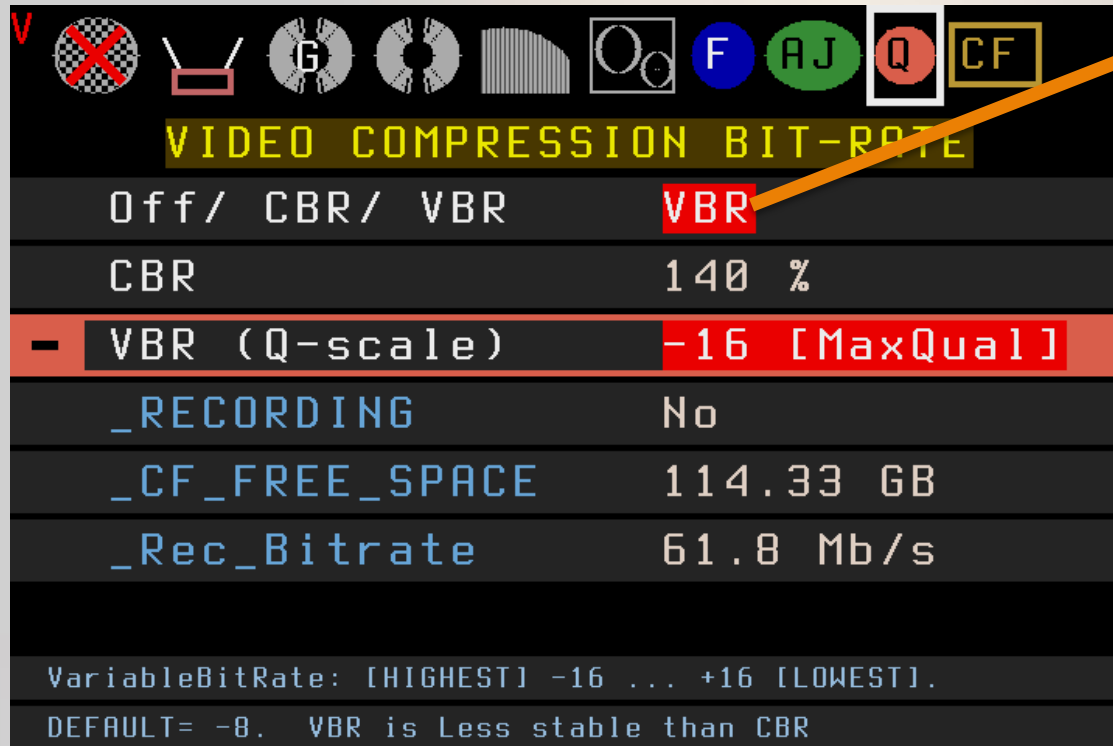

Note 1: CBR > 100%

- ❖ Should record **more detail**.
- ❖ When there is little image detail, the encoder will 'max out' (as it did in this example with Q=-10. When there is maximum image detail, Q=-16).

Note 2: CBR < 100%

- ❖ Records **Less detail**
- ❖ Longer record time (each clip has a file system limit of 4GB).
- ❖ Set to **10%** with the lens cap on when **only sound is required**.

Q = Video Compression

The screenshot shows a video compression menu with several icons at the top: a red 'X' in a circle, a white 'G' in a circle, a white 'Q' in a circle, a white 'F' in a circle, a green 'AJ' in a circle, a red 'Q' in a circle, and a yellow 'CF' in a square. Below the icons is the title 'VIDEO COMPRESSION BIT-RATE'. The main table has the following rows:

Off/ CBR/ VBR	VBR
CBR	140 %
- VBR (Q-scale)	-16 [MaxQual]
_RECORDING	No
_CF_FREE_SPACE	114.33 GB
_Rec_Bitrate	61.8 Mb/s

At the bottom of the menu, there is a note: 'VariableBitRate: [HIGHEST] -16 ... +16 [LOWEST]. DEFAULT= -8. VBR is Less stable than CBR'.

❖ Variable Bit Rate active.

Quality-Scale

- ❖ -16 = Max Quality
- 8 = Default Quality
- +16 = Low Quality

Note: VBR is LESS stable than CBR.

(Guess which one I use)

FIRST TIME RECORDING:

After switch on, the **first** recording performs Canon 'initialisation'.

This may cause the DryOs to run-out-of-steam (even without ML cranking up the bitRate!)

CF = Compact Flash

The top level of each CF should have the following ML files **copied** to it:

- ❖ autoexec.bin
- ❖ magiclantern.fir

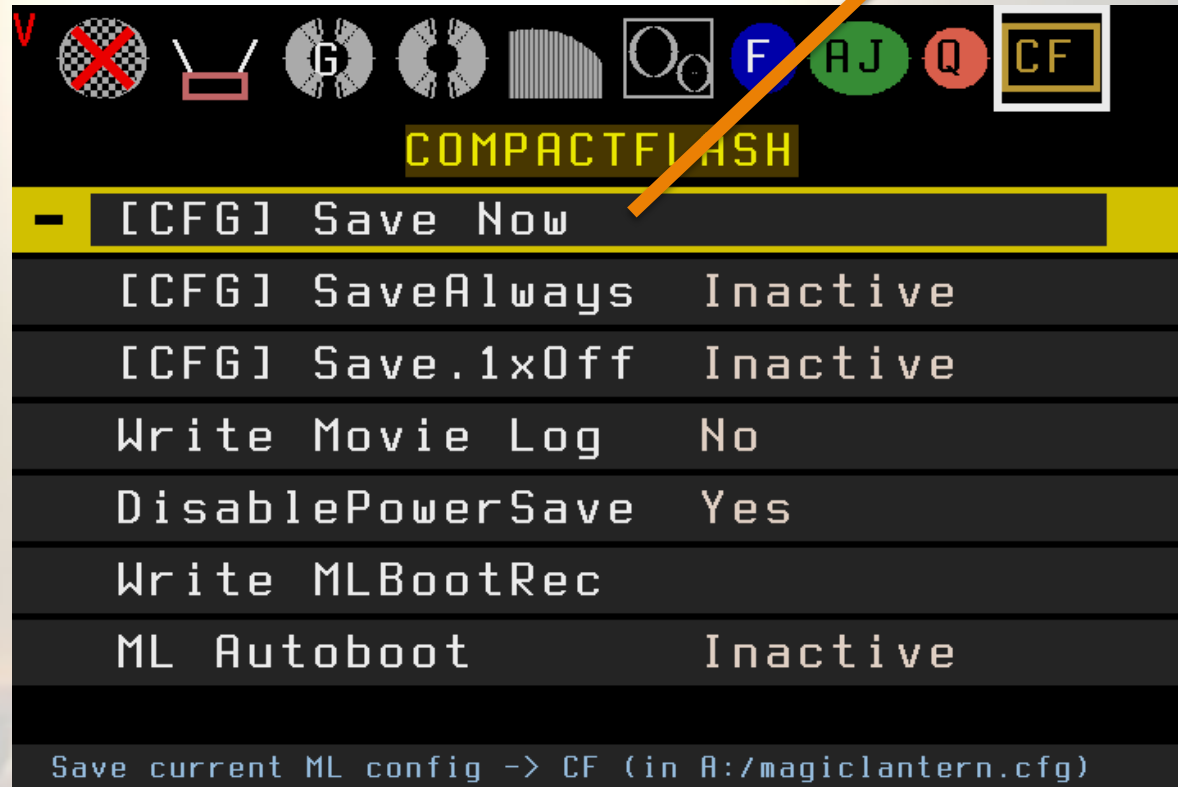

The following file is **created** when ML config is saved:

- ❖ magiclantern.cfg

The Canon 'DryOs' (it operating System) fragments the CF over time.

- ❖ **Periodically format** your CF's to get the fastest 'writing rates' from them.

- ❖ <Select> to save current ML ConFiG settings to CF

The screenshot shows the Magic Lantern menu with the 'CF' option highlighted. An orange arrow points from the 'CF' option in the menu to the text box on the right. The menu items are as follows:

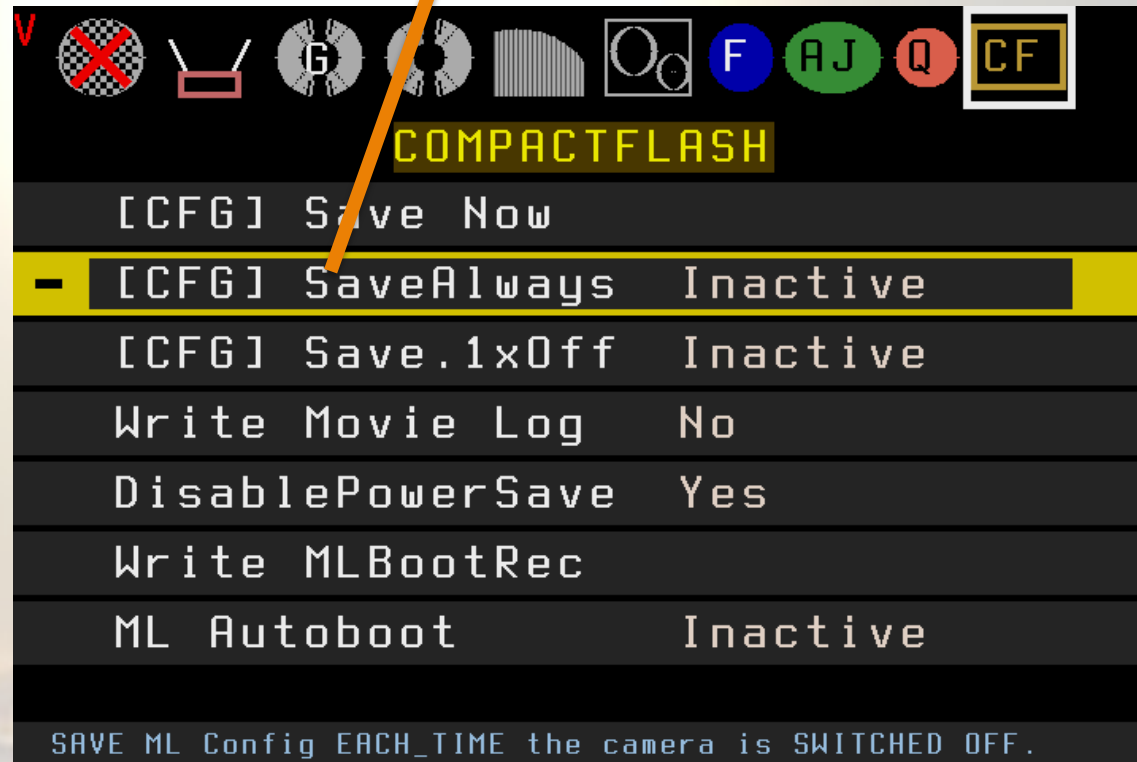

```
v
[Icons: X, G, O, F, AJ, Q, CF]
COMPACTFLASH
- [CFG] Save Now
[CFG] SaveAlways Inactive
[CFG] Save.1x0ff Inactive
Write Movie Log No
DisablePowerSave Yes
Write MLBootRec
ML Autoboot Inactive
Save current ML config -> CF (in A:/magiclantern.cfg)
```

CF = Compact Flash

CF Trivia:

The fastest cards that the 5D2 support are 'UDMA7'.

❖ When this option is Active, **EVERY** time the camera is switched off => the current ML Config is saved to CF.

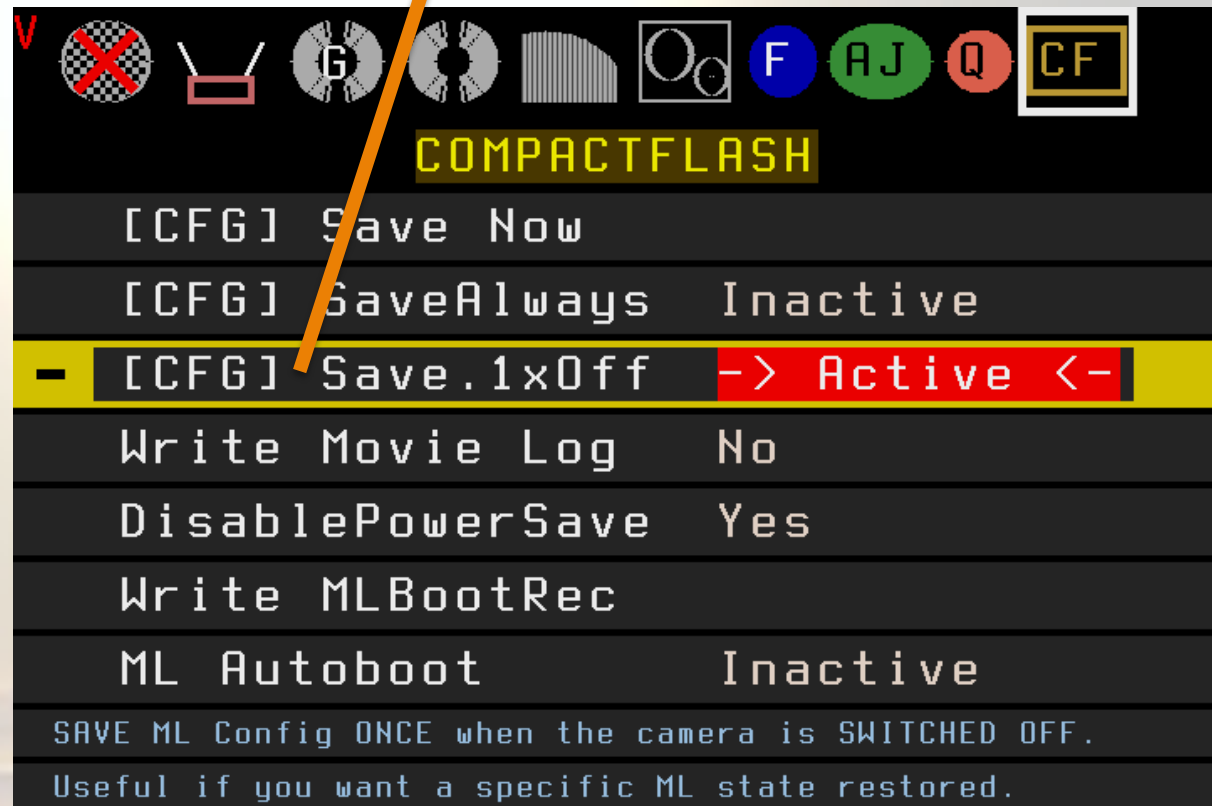

The screenshot shows a camera menu with various icons at the top. The 'COMPACTFLASH' option is highlighted in yellow. Below it, the following settings are visible:

[CFG] Save Now	
- [CFG] SaveAlways	Inactive
[CFG] Save.1xOff	Inactive
Write Movie Log	No
DisablePowerSave	Yes
Write MLBootRec	
ML Autoboot	Inactive

SAVE ML Config EACH_TIME the camera is SWITCHED OFF.

CF = Compact Flash

- ❖ When ML starts up, this field is Always set to Inactive.
- ❖ When set to Active, and the camera is switched off => the current ML Config is saved to CF.

The screenshot shows a camera menu with various icons at the top: a red 'X' in a circle, a red outline of a camera lens, a 'G' in a circle, a camera lens icon, a vertical bar graph, a 'Q' in a circle, a blue 'F' in a circle, a green 'AJ' in a circle, a red 'Q' in a circle, and a yellow 'CF' in a square. Below the icons, the text 'COMPACTFLASH' is displayed in yellow. The menu items are as follows:

```
[CFG] Save Now
[CFG] SaveAlways Inactive
- [CFG] Save.1xOff -> Active <-
Write Movie Log No
DisablePowerSave Yes
Write MLBootRec
ML Autoboot Inactive
```

At the bottom, there is a note: 'SAVE ML Config ONCE when the camera is SWITCHED OFF. Useful if you want a specific ML state restored.'

CF = Compact Flash

❖ When this is Yes, details of each movie recorded are written to a file called **movie.log** at the top level of the CF.

❖ The Canon DryOs default is to intelligently turn off your camera when not in use.
❖ This option is used to override (ie disable) this feature.

CF = Compact Flash

There are **two** ways of 'launching' Magic Lantern.

- ① Using the Canon Firmware Download menu.
- ② Or to reconfigure the Canon DryOs (ie make a change in the Non-volatile memory) so that when the camera is switched on next, it AutoBoots from the CF.

For AutoBoot to work, a MLBootRec must be written to the CF currently inserted (and ML code be on the CF!)

TIP: If you are going to use Autoboot -> get an Old CF, setup a MLBootRec on it, copy ML onto it. This is to cover you just incase there is a CF / ML issue that corrupts your 'only' CF .. (as you need ML to run to disable Autoboot!).

❖ Write the MLBootRecord to the current CF. (**Must** be done before ML AutoBoot is active!)

❖ When Active, and the camera is switched on, the Canon DryOs will boot directly into ML.

A large, bright sun in a dark sky, with the word "FIN" centered over it. The bottom of the image shows silhouettes of a festival or fair, including a Ferris wheel, a building, and a flagpole, against a hazy, golden background.

FIN
